

Centrix R15 Release Notes

Custom Tool-tips on Map Indicators

Channel indication graphical objects can now be assigned a static tool-tip text value. This allows additional information to be provided on the indication without having to supply a large caption.

Add static tool-tip to indicators by double-clicking them in the **Map Designer** and enter a value in the **Tooltip** text area.

Alerts Widget (Playback)

An Alerts Widget can now be added to the Playback screen for a site. This will display all the alerts that have fired and allow you to navigate to the time when the alert was fired.

To add the Alerts widget;

1. Load the site
2. Click **Configure** in the top toolbar
3. Tick the checkbox next to **Alerts**
4. Click **Apply**
5. Click **Save** on the top toolbar if you want the widget to be permanently shown for this site

Live Status of Alerts on Map (Playback)

The map can now be used as a real-time panel for alerts. Any alerts that are currently active (fired) on a channel will be shown against the asset on the map.

Active alerts are represented as a red flashing alarm bell on the asset(s) the alert is related to.

Currently this is an indication of the **current** status of alerts, not the status in relation to the time selected for replay. We aim to improve this in a future release.

Other Noteworthy Amendments

- Huge performance improvement when loading event data for old SA380 sites.
- Huge performance improvement when loading event data for SSI/TDM sites.
