

Assets

Background

Assets provide a way of structuring data inputs and associated metadata into contextual entities. Historically, all Centrix features were driven by selecting sites and channels, and the filtering of these items were not specific to the context of the feature you are using.

By providing and configuring Assets, the user experience of Centrix can be vastly improved. Relevant data for an asset can be easily collated into streamline views, and features can be closely tied to the asset types they were intended for.
